

**WHAT IS CLAIMED IS:**

1. A sound controller, comprising:

means for sound source reproduction, which reproduces sound source information for each channel, in accordance with sequence information controlling a sound source reproducing operation for each channel; and

means for adjusting an output level of the sound source information reproduced by the sound source reproduction means, minimally responsive to a scene or a situation.

2. The sound controller according to claim 1, wherein the output level adjusting means performs control of output and non-output of the sound source information reproduced by the sound source reproduction means, minimally responsive to a scene or a situation.

3. The sound controller according to claim 1, wherein the sequence information comprises MIDI (Musical Instrument Digital Interface) information.

4. A method for controlling sound, comprising steps of: reproducing sound source information for each channel, in accordance with sequence information controlling a sound source reproducing operation for each channel; and

adjusting an output level of the reproduced sound source information, minimally responsive to a scene or a situation.

5. The method for controlling sound according to claim 4, further comprising a step of:

controlling output and non-output of the reproduced  
5 sound source information, minimally responsive to a scene or a situation.

6. The method for controlling sound according to claim 4, further comprising a step of:

10 reproducing the sound source information of each channel, in accordance with MIDI information acting as the sequence information.

7. A program execution apparatus for executing a sound control program, the sound control program comprising:

15 a step of reproducing sound source information for each channel, in accordance with sequence information controlling a sound source reproducing operation for each channel; and

a step of adjusting an output level of the reproduced  
20 source information, minimally responsive to a scene or a situation.

8. The program execution apparatus for executing a sound control program according to claim 7, the sound control program  
25 comprising:

a step of controlling output and non-output of the

reproduced sound source information, minimally responsive to a scene or a situation.

9. The program execution apparatus for executing a sound control program according to claim 7, the sound control program comprising:

a step of reproducing the sound source information for each channel, in accordance with MIDI information acting as the sequence information.

10. A computer-readable storage medium having recorded therein a sound control program to be executed on a computer, the sound control program comprising:

a step of reproducing sound source information for each channel, in accordance with sequence information controlling a sound source reproducing operation for each channel; and

a step of adjusting an output level of the reproduced source information, minimally responsive to a scene or a situation.

11. The computer-readable storage medium having recorded therein a sound control program to be executed on a computer according to claim 10, the sound control program comprising:

a step of controlling output and non-output of the reproduced sound source information, minimally responsive to a scene or a situation.

12. The computer-readable storage medium having recorded therein a sound control program to be executed on a computer according to claim 10, the sound control program comprising:

5 a step of reproducing the sound source information for each channel, in accordance with MIDI information acting as the sequence information.

13. A sound control program to be executed on by a computer, comprising:

10 a step of reproducing sound source information for each channel, in accordance with sequence information controlling a sound source reproducing operation for each channel; and

15 a step of adjusting an output level of the reproduced source information, minimally responsive to a scene or a situation.

14. A sound controller, comprising:

20 a sound source reproduction unit, that reproduces sound source information for each channel, in accordance with sequence information controlling a sound source reproducing operation for each channel; and

25 an output level adjusting unit, which adjusts a output level of the sound source information reproduced by the sound source reproduction unit, minimally responsive to a scene or a situation.
